# Assignment 8: Time Series Analysis

#### Erin Ansbro

#### Fall 2023

#### **OVERVIEW**

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

#### **Directions**

- Rename this file <FirstLast>\_A08\_TimeSeries.Rmd (replacing <FirstLast> with your first and last name).
- 2. Change "Student Name" on line 3 (above) with your name.
- 3. Work through the steps, **creating code and output** that fulfill each instruction.
- 4. Be sure to **answer the questions** in this assignment document.
- 5. When you have completed the assignment, **Knit** the text and code into a single PDF file.

# Set up

- 1. Set up your session:
- Check your working directory
- Load the tidyverse, lubridate, zoo, and trend packages
- Set your ggplot theme

```
#setting up workspace
getwd()
```

## [1] "C:/Users/eka19/OneDrive - Duke University/Documents/872/EDE\_Fall2023"

#### library(tidyverse)

```

## i Use the conflicted package (<a href="http://conflicted.r-lib.org/">http://conflicted.r-lib.org/</a>) to force all conflicts to become error
```

2. Import the ten datasets from the Ozone\_TimeSeries folder in the Raw data folder. These contain ozone concentrations at Garinger High School in North Carolina from 2010-2019 (the EPA air database only allows downloads for one year at a time). Import these either individually or in bulk and then combine them into a single dataframe named GaringerOzone of 3589 observation and 20 variables.

```
#2 reading in data
Ozone2010 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2010_raw.csv",
                     stringsAsFactors=TRUE)
Ozone2011 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2011_raw.csv",
                     stringsAsFactors=TRUE)
Ozone2012 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2012_raw.csv",
                     stringsAsFactors=TRUE)
Ozone2013 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2013_raw.csv",
                     stringsAsFactors=TRUE)
Ozone2014 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2014_raw.csv",
                      stringsAsFactors=TRUE)
Ozone2015 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2015_raw.csv",
                     stringsAsFactors=TRUE)
Ozone2016 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2016_raw.csv",
                     stringsAsFactors=TRUE)
Ozone2017 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2017_raw.csv",
                     stringsAsFactors=TRUE)
Ozone2018 <-read.csv("./Data/Raw/Ozone_TimeSeries/EPAair_03_GaringerNC2018_raw.csv",
                     stringsAsFactors=TRUE)
```

# Wrangle

- 3. Set your date column as a date class.
- 4. Wrangle your dataset so that it only contains the columns Date, Daily.Max.8.hour.Ozone.Concentration, and DAILY\_AQI\_VALUE.
- 5. Notice there are a few days in each year that are missing ozone concentrations. We want to generate a daily dataset, so we will need to fill in any missing days with NA. Create a new data frame that contains a sequence of dates from 2010-01-01 to 2019-12-31 (hint: as.data.frame(seq())). Call this new data frame Days. Rename the column name in Days to "Date".
- 6. Use a left\_join to combine the data frames. Specify the correct order of data frames within this function so that the final dimensions are 3652 rows and 3 columns. Call your combined data frame GaringerOzone.

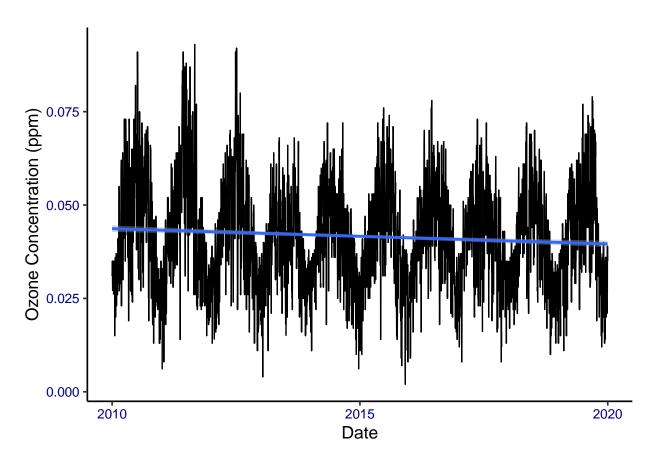

# Visualize

7. Create a line plot depicting ozone concentrations over time. In this case, we will plot actual concentrations in ppm, not AQI values. Format your axes accordingly. Add a smoothed line showing any linear trend of your data. Does your plot suggest a trend in ozone concentration over time?

```
#7 Ozone over time plot
GaringerPlot <- ggplot(GaringerOzone, aes(x=Date, y=Daily.Max.8.hour.Ozone.Concentration))+
   geom_line()+
   geom_smooth(method = lm)+
   ylab("Ozone Concentration (ppm)")
print(GaringerPlot)</pre>
```

```
## 'geom_smooth()' using formula = 'y ~ x'
```

## Warning: Removed 63 rows containing non-finite values ('stat\_smooth()').

Answer: The plot suggests there is a slight decrease trend over time from 2010 to 2019.

# Time Series Analysis

Study question: Have ozone concentrations changed over the 2010s at this station?

8. Use a linear interpolation to fill in missing daily data for ozone concentration. Why didn't we use a piecewise constant or spline interpolation?

```
#8 Linear Interpolation
head(GaringerOzone)
```

```
Date Daily.Max.8.hour.Ozone.Concentration DAILY_AQI_VALUE

OzoneInterpolation <- ggplot(GaringerOzoneClean) +
  geom_line(aes(x = Date, y = ppm.clean), color = "red") +
  geom_line(aes(x = Date, y = Daily.Max.8.hour.Ozone.Concentration), color = "black") +
  ylab("Ozone Concentration (ppm)")

print(OzoneInterpolation)</pre>
```

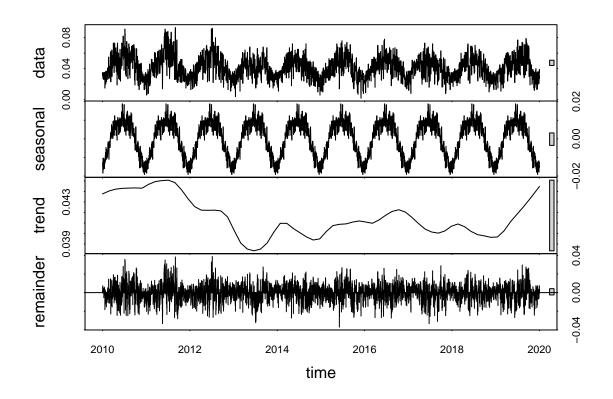

Answer: It does appear ozone concetrations have changed over time. In the early 2010s there were higher levels, reaching above .075 ppm. Overtime, those highs have lowered to right at or under .075 ppm. A linear interpolation was used because we want to know the missing values between the dots. Spline was not used because we are not using a quadratic equation to find the distances, just a straight line. Piecewise was not used because we are connecting by the past and previous data points, we do not need a peicewise function that has different values for different steps.

9. Create a new data frame called GaringerOzone.monthly that contains aggregated data: mean ozone concentrations for each month. In your pipe, you will need to first add columns for year and month to form the groupings. In a separate line of code, create a new Date column with each month-year combination being set as the first day of the month (this is for graphing purposes only)

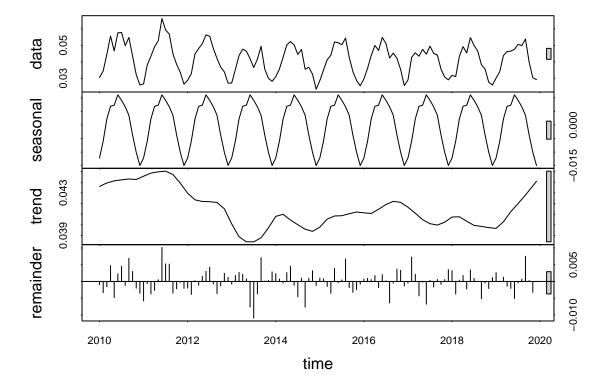

10. Generate two time series objects. Name the first GaringerOzone.daily.ts and base it on the dataframe of daily observations. Name the second GaringerOzone.monthly.ts and base it on the monthly average ozone values. Be sure that each specifies the correct start and end dates and the frequency of the time series.

11. Decompose the daily and the monthly time series objects and plot the components using the plot() function.

```
#11 Decompose daily
GaringerOzone.daily.ts.decomp <- stl(GaringerOzone.daily.ts,s.window = "periodic")
plot(GaringerOzone.daily.ts.decomp)</pre>
```

# #Decompose monthly GaringerOzone.monthly.ts.decomp <- stl(GaringerOzone.monthly.ts,s.window = "periodic") plot(GaringerOzone.monthly.ts.decomp)</pre>

12. Run a monotonic trend analysis for the monthly Ozone series. In this case the seasonal Mann-Kendall is most appropriate; why is this?

```
#12 Run SMK test monthly
Ozone_Monthly_SMK <- Kendall::SeasonalMannKendall(GaringerOzone.monthly.ts)

Dzone_Monthly_SMK

## tau = -0.143, 2-sided pvalue =0.046724

summary(Ozone_Monthly_SMK)

## Score = -77 , Var(Score) = 1499
## denominator = 539.4972
## tau = -0.143, 2-sided pvalue =0.046724</pre>
```

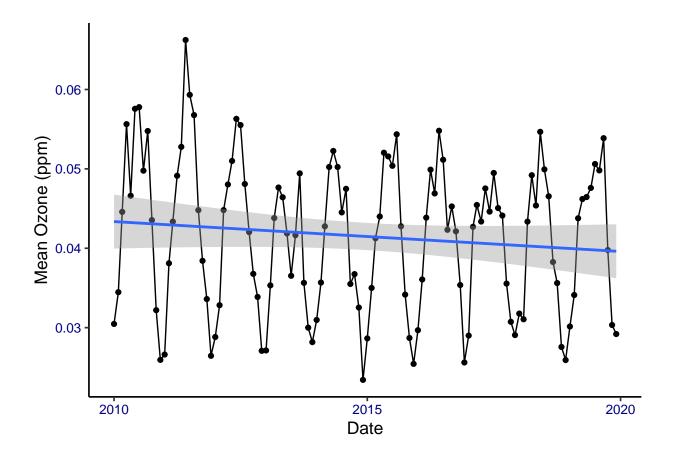

Answer: From the Decompose Plots, I see there is strong seasonality. Therefore, I need a trend test that includes seasonality in its calculations. In addition, missing data is allowed in a SM test.

13. Create a plot depicting mean monthly ozone concentrations over time, with both a geom\_point and a geom\_line layer. Edit your axis labels accordingly.

```
# 13 Visualization
Ozone_Plot <-
ggplot(GaringerOzone.monthly, aes(x = Date, y = MeanPPM)) +
  geom_point() +
  geom_line() +
  ylab("Mean Ozone (ppm)") +
  geom_smooth( method = lm )

print(Ozone_Plot)</pre>
```

## 'geom\_smooth()' using formula = 'y ~ x'

14. To accompany your graph, summarize your results in context of the research question. Include output from the statistical test in parentheses at the end of your sentence. Feel free to use multiple sentences in your interpretation.

Answer: Study question: Have ozone concentrations changed over the 2010s at this station?

Ozone concentrations have changed over the 2010s at this station. Visually, you can see the linear regression line decrease moderately from 2010 to 2019. Looking at the summary statistics, the p-value is <.05 at about .04, meaning the null hypothesis that ozone does not change should be rejected in favor that ozone does change. (Score = -77, Var(Score) = 1499 denominator = 539.4972 tau = -0.143, 2-sided pvalue = 0.046724).

- 15. Subtract the seasonal component from the GaringerOzone.monthly.ts. Hint: Look at how we extracted the series components for the EnoDischarge on the lesson Rmd file.
- 16. Run the Mann Kendall test on the non-seasonal Ozone monthly series. Compare the results with the ones obtained with the Seasonal Mann Kendall on the complete series.

```
#15 Removing seasonality
Components <- as.data.frame(GaringerOzone.monthly.ts.decomp$time.series[,1:3])
#left in my original idea about how to subtract seasonality,
#then an updated try based on Luana's announcement. Leaving it in for future reference.
\#Ozone\_NoSeasonal < -GaringerOzone.monthly.ts.decomp$time.series[,2:3]
Ozone_NoSeasonal2 <-Components$trend+Components$remainder</pre>
#16 Run MK test monthly
#Ozone_Monthly_MK <- Kendall::MannKendall(Ozone_NoSeasonal)
Ozone_Monthly_MK2 <- Kendall::MannKendall(Ozone_NoSeasonal2)</pre>
#Ozone Monthly MK
#summary(Ozone_Monthly_MK)
Ozone_Monthly_MK2
## tau = -0.165, 2-sided pvalue =0.0075402
summary(Ozone_Monthly_MK2)
## Score = -1179, Var(Score) = 194365.7
## denominator = 7139.5
## tau = -0.165, 2-sided pvalue =0.0075402
```

Answer: The results appear to be stronger in regards that ozone has decreased over time. The p-value is now at .0075 instead of about .04.
